ABSTRACT

INTRODUCTION: The vulva and vagina are of great significance to womanhood owing to the myriads of specialized functions they perform. The diseases of this organ have physical, social, mental, and psychological ramifications. The aim of this work is to study the pathological pattern and clinical presentation of diseases of the vulva and vagina at the Department of Anatomical Pathology and Forensic Medicine of the Jos University Teaching Hospital between 1st January 2011 and December 31st, 2020.

METHODOLOGY: This study is descriptive of all cases of histologically diagnosed vulval and vaginal lesions seen at the Center. Histological diagnosis, biodata, and clinical information of patients were retrieved from the medical records. Data realized were analyzed and presented in tables as simple frequencies, percentages, ranges, and measures of central tendencies.

RESULTS: Two hundred and fifteen vulval and vaginal biopsies were included in the study. Squamous cell carcinoma was the commonest histologically diagnosed lesion accounting for 70(32.6%) cases of all lesions and 77.8% of all malignancies. The second commonest lesion and the most frequent benign pathology is the Condyloma acuminatum (viral warts) which accounted for 41(19.1%) cases. The age bracket 20 to 59 years constituted 79.5% of cases (171 cases). The age range, mean, median, and mode in years were 5.0–85.0, 39.5+15.9, 38.0, and 50.0 respectively.

CONCLUSION: Squamous cell carcinoma and venereal warts are the commonest lesions of the vulva and vagina in our environment. Robust vaccination programs against the etiological agent, the human papilloma virus is highly recommended. WAJM 2023; 40(3): 241–246.

Keywords: Vulva, Vagina, Cancer, Wart.

RÉSUMÉ

INTRODUCTION: La vulve et le vagin ont une importance considérable pour la féminité en raison des myriades de fonctions spécialisées qu'ils remplissent. Les maladies de cet organe ont des ramifications physiques, sociales, mentales et psychologiques. L'objectif de ce travail est d'étudier le modèle pathologique et la présentation clinique des maladies de la vulve et du vagin au département de pathologie anatomique et de médecine légale de l'hôpital universitaire de Jos entre le 1er janvier 2011 et le 31 décembre 2020.

METHODOLOGIE: Cette étude est descriptive de tous les cas de lésions vulvaires et vaginales diagnostiquées histologiquement au Centre. Le diagnostic histologique, les données biologiques et les informations cliniques des patientes ont été extraits des dossiers médicaux. Les données obtenues ont été analysées et présentées dans des tableaux sous forme de fréquences simples, de pourcentages, d'intervalles et de mesures de tendances centrales.

RÉSULTATS: Deux cent quinze biopsies vulvaires et vaginales ont été incluses dans l'étude. Le carcinome épidermoïde était la lésion histologiquement diagnostiquée la plus fréquente, représentant 70 (32,6 %) cas de toutes les lésions et 77,8 % de toutes les tumeurs malignes. La deuxième lésion la plus fréquente et la pathologie bénigne la plus fréquente est le condylome acuminé (verrues virales), qui représente 41 (19,1 %) cas. La tranche d'âge de 20 à 59 ans représentait 79,5 % des cas (171 cas). La fourchette d'âge, la moyenne, la médiane et le mode en années étaient respectivement de 5,0-85,0, 39,5+15,9, 38,0 et 50,0.

CONCLUSION: le carcinome épidermoïde et les verrues générales sont les lésions les plus fréquentes de la vulve et du vagin dans notre environnement. Des programmes de vaccination robustes contre l'agent étiologique de cette pathologie, le virus du papillome humain, sont fortement recommandés. WAJM 2023; 40(3): 241–246.

Mots clés: Vulve, Vagin, Cancer, Verrue.
