ABSTRACT

BACKGROUND: School environment entails the sum total of the physical, biological, social, and emotional environment within which members of the school community operate. It is essential to make the school environment healthy to promote and protect the health of school pupils as well as their safety. This study aimed at finding the level of implementation of a Healthy School Environment (HSE) in Ido/Osi Local Government Area (LGA) of Ekiti State.

METHODOLOGY: A cross-sectional descriptive study carried out among 48 private and 19 public primary schools using a standardised checklist and direct observation.

RESULTS: The teacher-to-pupil ratio was 1:16 in public schools and 1:10 in private schools. The leading source of water in 47.8% of the schools was well water. Most, 97%, of the schools practiced open dumping of refuse. Private schools had more school buildings with strong walls and good roofs with doors and windows which provided adequate ventilation compared to the public schools ($p < 0.001$). No school was located close to an industrial area, however, none had a safety patrol team. Only 34.3% of schools had a fence and 31.3% had terrains prone to flooding. Only 3% of the schools, all private schools, attained the minimum acceptable score on the school environment.

CONCLUSION: The status of school environment was poor in the study location and school ownership did not make any much impact as there was no difference in the situations of school environment between public and private schools.

RÉSUMÉ

CONTEXTE: L'environnement scolaire est l'ensemble des conditions physiques, biologiques, sociales et émotionnelles dans lesquelles évoluent les membres de la communauté scolaire. Il est essentiel de rendre l'environnement scolaire sain afin de promouvoir et de protéger la santé des élèves ainsi que leur sécurité. Cette étude visait à déterminer le niveau de mise en œuvre de l'environnement scolaire sain (HSE) dans la zone de gouvernement local (LGA) d'Ido/Osi de l'État d'Ekiti.

MÉTHODOLOGIE: Une étude descriptive transversale a été menée dans 48 écoles primaires privées et 19 écoles primaires publiques à l'aide d'une liste de contrôle standardisée et d'une observation directe.

RÉSULTATS: Le ratio enseignant/élèves était de 1:16 dans les écoles publiques et de 1:10 dans les écoles privées. La principale source d'eau dans 47,8 % des écoles était l'eau de puits. La plupart des écoles (97%) pratiquaient le dépôt d'ordures à l'air libre. Les écoles privées avaient plus de bâtiments scolaires avec des murs solides et de bons toits avec des portes et des fenêtres qui fournissaient une ventilation adéquate par rapport aux écoles publiques ($p < 0.001$). Aucune école n'était située à proximité d'une zone industrielle, mais aucune ne disposait d'une équipe de patrouille de sécurité. Seules 34,3 % des écoles disposaient d'une clôture et 31,3 % étaient situées sur des terrains inondables. Seules 3 % des écoles, toutes privées, ont atteint le score minimum acceptable en matière d'environnement scolaire.

CONCLUSION: L'état de l'environnement scolaire était médiocre dans la région étudiée et la propriété de l'école n'avait pas beaucoup d'impact car il n'y avait pas de différence dans la situation de l'environnement scolaire entre les écoles publiques et les écoles privées.
