Spectrum of Skin Diseases among Inmates in a Nigerian Correctional Centre in Southern Nigeria

Spectre des Maladies Cutanées chez les Détenus dans un Centre Pénitentiaire Nigérian du Sud du Nigeria

ABSTRACT

BACKGROUND: Cutaneous morbidities are not uncommon in correctional centres and environmental cleanliness and sanitation practices influence their prevalence and pattern. Overcrowding and poor living conditions are common in correctional facilities and may increase the prevalence of skin diseases amongst inmates. This study aimed to determine the prevalence and pattern of dermatoses in a correctional centre in southern Nigeria.

MATERIALS AND METHODS: The study was an institutional-based cross-sectional descriptive study carried out during a health outreach to the facility involving inmates of a correctional centre in southern Nigeria. Using a purpose-designed questionnaire, socio-demographic data containing information on sex, age, prison status, and number of inmates per room was obtained from a total of 252 inmates who consented to the study. They were subsequently clinically examined for skin diseases. Dermatological tools like dermoscopes were used to boost diagnostic accuracy where expedient. All data collected were subsequently analysed using SPSS version 23.0.

RESULTS: The prevalence of cutaneous morbidities amongst the inmates was 224(88.9%). A total of 332 skin morbidities were observed in 224 prison inmates with a ratio of 1.5:1 per affected inmate. The common dermatoses encountered in our study were scabies 181(71.8%), bedbugs 38(15.1%), dermatophytosis 24(9.5%), pityriasis versicolor 20(7.9%), and pediculosis 18(7.1%) in a decreasing order of frequency.

CONCLUSION: Cutaneous morbidities are common among prison inmates in southern Nigeria. Scabies was the most common dermatoses observed. **WAJM 2024; 41 (5): 568 - 574**

RÉSUMÉ

CONTEXTE: Les morbidités cutanées ne sont pas rares dans les centres pénitentiaires et les pratiques d'hygiène et d'assainissement de l'environnement influencent leur prévalence et leur répartition. Le surpeuplement et les mauvaises conditions de vie sont courants dans les établissements pénitentiaires et peuvent augmenter la prévalence des maladies de la peau chez les détenus. Cette étude visait à déterminer la prévalence et la répartition des dermatoses dans un centre pénitentiaire nigérian du sud du.

MÉTHODES: Il s'agissait d'une étude descriptive transversale institutionnelle réalisée lors d'une campagne de santé dans l'établissement, impliquant des détenus d'un centre pénitentiaire du sud du Nigeria. À l'aide d'un questionnaire spécialement conçu, des données sociodémographiques contenant des informations sur le sexe, l'âge, le statut pénitentiaire et le nombre de détenus par cellule ont été recueillies auprès de 252 détenus ayant donné leur consentement à l'étude. Ils ont ensuite été examinés cliniquement pour les maladies cutanées. Des outils dermatologiques comme les dermoscopes ont été utilisés pour améliorer la précision du diagnostic lorsque cela était nécessaire. Toutes les données collectées ont été analysées à l'aide de SPSS version 23.0.

RÉSULTATS: La prévalence des morbidités cutanées chez les détenus était de 224 (88,9%). Un total de 332 morbidités cutanées ont été observées chez 224 détenus, soit un ratio de 1,5 : 1 par détenus atteint. Les dermatoses les plus fréquentes observées dans notre étude étaient la gale (181, 71,8 %), les punaises de lit (38, 15,1 %), la dermatophytose (24, 9,5 %), le pityriasis versicolor (20, 7,9 %) et la pédiculose (18, 7,1 %) dans l'ordre décroissant de fréquence.

CONCLUSION: Les morbidités cutanées sont fréquentes chez les détenus du sud du Nigeria. La gale était la dermatose la plus fréquente observée. **WAJM 2024; 41 (5): 568 - 574**
